There are different types of configuration on computer system like Graphic card memory , your system model , operating system, system manufacture , processor etc etc. But how to check it all? This is simple thing in computer but many users may getting trouble because they don't know about it. Today, I am here with simple but very useful knowledge.

I am providing two methods here:

Method 1

Click on start button and go to Run, then type msinfo32.exe

In new window your system configuration will be displayed

Click on + button and choose Hardware Resources, Components, Software environment

(This method may be difficult for some newbie computer users. So I am writing about second method .)

Method 2

Go to "start" type "Run" and search for "dxdiag" and that's all. You will be viewing your system details.
